

Fictious Airways

Committed to Flying Safer

Fictious Airways has identified that the number of crashes and elevated loss of life has caused air travel to reach all new lows over the last few months. Fictious Airlines is taking actions to prove its commitment to safer air travel. To help display this commitment we are decommisioning three of our model aircraft.

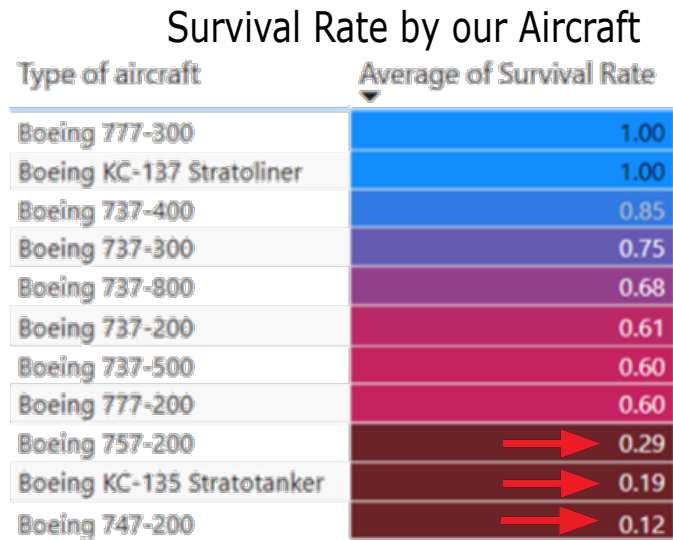

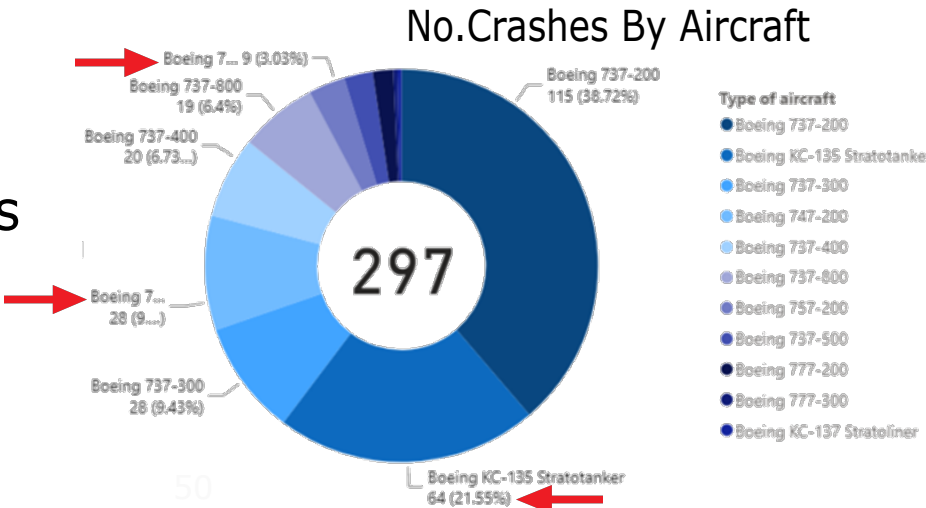

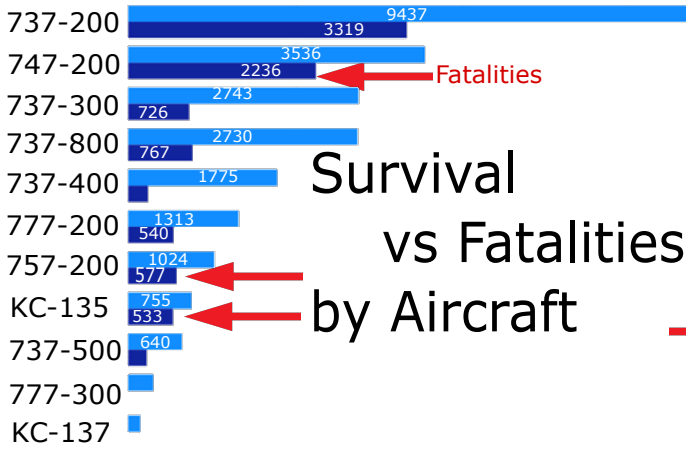

As a world leader in avaiation we pride ourselves in our ability to fly our customers to domestic and international destinations. However, at the same token, our safety record in fatalities over the years has declined therefore, requiring us to rethink ourselves.

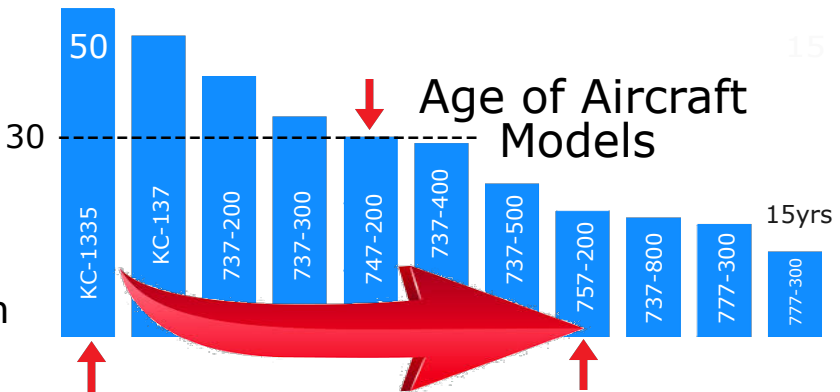

Current Survival Rate

0.50

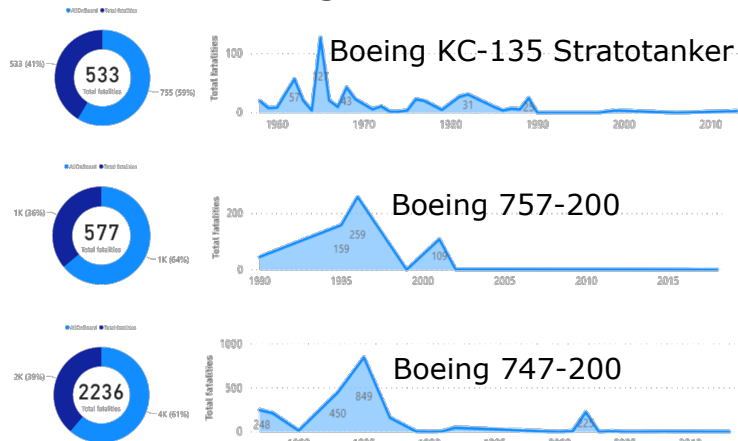

Our goal is to ensure the safety of each and every passenger.

Not all aircraft are equal as some have high crash counts. However, have high survival rates. As in the case of the Boeing 737-200. Allowing it to be identified as a safer aircraft.

Aircraft Targeted to Decommission

After carefully analyzing our aircraft we have determined three models to be decommisioned from service based on the age of the aircraft and its history of crashes in conjunction with high counts of fatalities. Thereby resulting in an increased safety score and improved survival rate.

Increased Safety Survival Rate

0.67
